

I am a member of EAE Inc. and our project is creating a community research page specifically for Merrimack College faculty. This will be a web application that allows staff to communicate about their own research, ask questions or post ideas in an open forum, and be able to upload and access different articles as well as resources provided by other members of the research page.

For this past sprint, I have spent most of my time creating the front end pages that were still a work in progress. I was able to create a profile update screen, design a resource upload screen, and create a first version of the instrument consortium page. In addition, I worked on finishing up the forum posting logic for the backend and began linking the backend logic to the database. I also spent some time reorganizing the main page to make it more visually appealing and cleaner.

This next sprint I plan to spend most of my time working with Ayden to connect these front end pages to the backend. I will be doing a lot of the API calls and will be working on allowing the forum posts to have likes and comments. During this sprint, I would also like to get some of the notification popups created. My team also has a meeting scheduled with our client to get further confirmation about the distribution of content and the setup of the page. Based on that meeting, I will update the design accordingly.
